

# Proloquo2Go

Augmentative and Alternative Communication  
for iPhone and iPod touch

## A visual usage scenario

...A boy with an autism spectrum disorder who has difficulty using his natural voice to speak, is sitting at home with his parents in the evening before bedtime. They recently bought an iPod touch and Proloquo2Go for him...

The boy can press buttons to navigate to all kinds of categories and speak messages by tapping the message window.

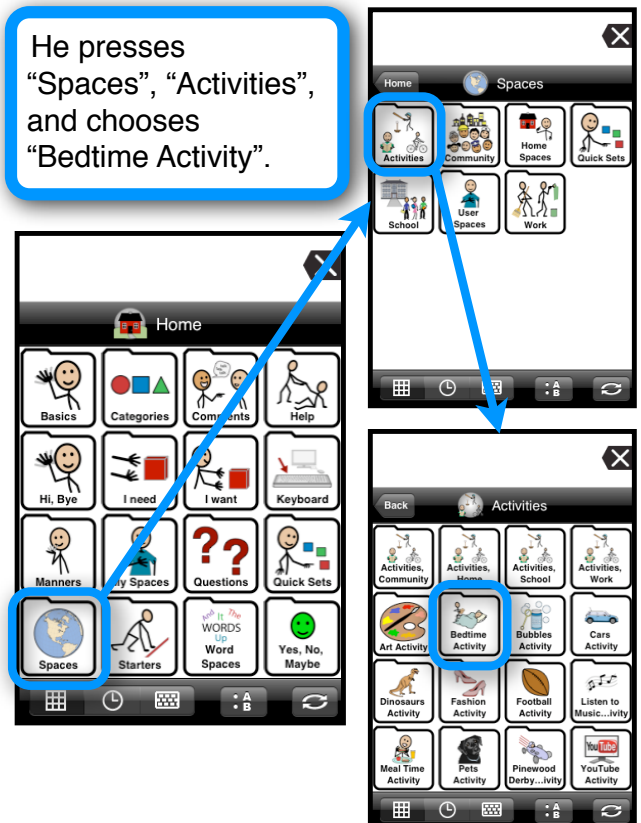

1

He can go to the Typing view and use the iPhone keyboard to type a paragraph. He can hit save and the text is automatically symbolized.

2

He presses "Spaces", "Activities", and chooses "Bedtime Activity".

3

He selects some items and then presses the message window to speak the message.

4

He can delete items in the message window...  
N.B. Double tap to clear.

5

He presses and holds the *sleep* item to automatically get access to conjugations, plurals or possessives.

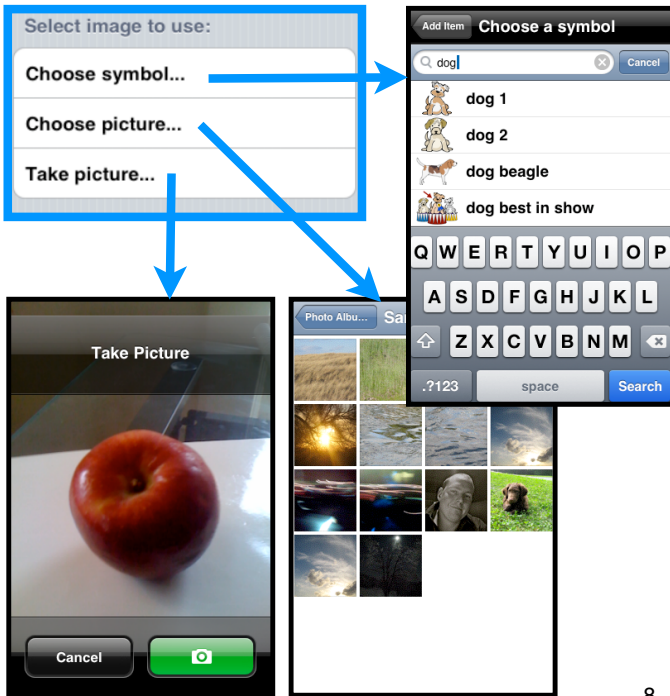

6

He can press the plus button to add items from the message window into the vocabulary.

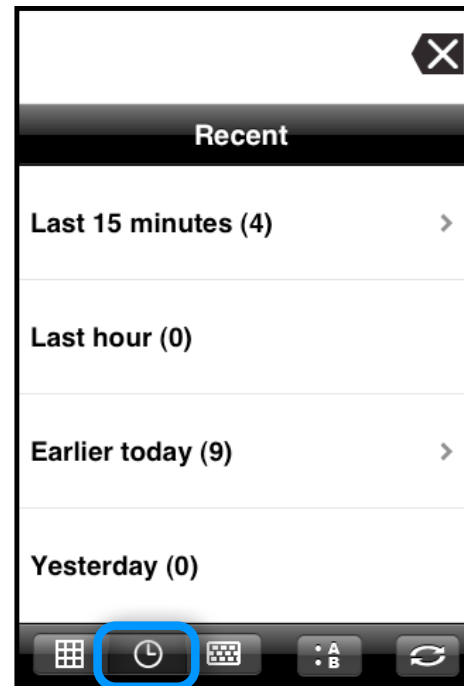

7

He can choose a symbol for that new item... or a photo.

8

He can select the Recent view from the bottom toolbar to access recently spoken items.

9

He can tap and add items from Recents to the message window or press the plus to add to the vocabulary.

10

His parents can use the Options view and the Proloquo2Go section of the Settings application to customize the App to his needs: Disable images, have smaller or bigger items, change background and text colors, restrict editing and more.
